We're turning surgical precision into perfection.

Over the past year, Dr. Xiaoli Zhang and her team of Wilkes students have been working with Geisinger Medical Center to develop the first prototype of a revolutionary surgical device. Controlled remotely and able to maneuver inside the body, this robotic device would allow doctors to shorten the length of incisions, vastly decreasing the chance for infection—which also means improving the prospects of a healthy recovery. It's the type of flagship project that only comes around so often—one inspired by the vision of an Army of Colonels, strengthened by the support of a community that cares.
